

Michael Braverman

DevOps/Systems Engineer

✉ mbraverman96@gmail.com 📍 Dubai, UAE 🌐 <https://github.com/mbrav> 🔗

Summary

DevOps / SRE & AI Systems Engineer building reliable infrastructure, developer tooling, Kubernetes platforms, and self-hosted LLM systems. Fluent in Python, Go, and Rust; focused on automation, observability, performance, and practical business impact.

Experience

International HFT Hedge-Fund

2023-10 – Present

DevOps/AI Engineer

- Automated deployment of infrastructure across AWS and other cloud platforms using Terraform and Pulumi, improving scalability, reducing manual overhead, and accelerating time to market.
- Built and maintained Kubernetes infrastructure across bare-metal and cloud environments using Kubespray, Talos Linux, GitLab CI, and Argo CD, enabling reliable and repeatable platform operations.
- Implemented robust observability across diverse infrastructure—cloud VMs, Kubernetes workloads, bare-metal servers, and networking hardware—using CloudWatch, Prometheus, Grafana LGTM Stack, Zabbix, VictoriaMetrics, and the ELK Stack.
- Supported tracing, profiling, and performance analysis workflows using Grafana Alloy, Tempo, and Pyroscope to improve visibility into distributed systems and application behavior.
- Played a key role in incident response for latency-sensitive trading systems, maintaining sub-30-minute response times during critical on-call rotations.
- Built custom tooling with Python, Go, and AWS Lambda to integrate CloudWatch and Cost Explorer APIs, automating the delivery of cloud usage and cost reports via Slack, significantly improving visibility and cost management across the company.
- Developed AI-driven automation pipelines for processing confidential data using self-hosted open-weight LLMs, enabling internal automation while preserving data control and privacy.
- Administered and tuned self-hosted llama.cpp servers for confidential data workloads, improving the reliability and performance of internal LLM services.
- Built agentic and RAG-based workflows using LangGraph, LangChain, and Langfuse, supporting retrieval-augmented generation, LLM evaluation, tracing, and observability.
- Developed multi-modal search capabilities over PostgreSQL using BM25, vector search, and graph-based retrieval to improve information discovery across internal datasets.
- Built AI application components across Python, Rust, and Go using LangGraph, rig, and eino, integrating LLM workflows into production-oriented automation systems.
- Developed automated DevSecOps auditing tools for monitoring user accounts across LDAP and other authentication backends, streamlining access reviews.
- Provided infrastructure and CI/CD support for C++ build systems, ensuring reliable and repeatable builds.

CentrInform

2022-11 – 2023-10

DevOps Engineer

- Oversaw the operation and deployment lifecycle of more than 40 Java/Go microservices handling 2–12k RPS, while ensuring high availability and consistent performance within a Kubernetes environment.
- Ensured 99.99% SLA uptime by managing SRE on-call responsibilities and utilizing tools such as Zabbix, Grafana and Prometheus for monitoring and issue diagnostics;
- Managed an on-premise infrastructure consisting of ~100 virtual machines and 20 bare-metal servers, deploying technologies including GitLab CI, Kubernetes, Minio, Consul, Vault, ELK, HAProxy, Patroni, PostgreSQL, and ClickHouse;
- Implemented IaC and CI/CD pipelines, contributing to the migration to GitLab CI + Argo CD while automating infrastructure management with Terraform and Ansible;

- Led a comprehensive infrastructure overhaul, rebuilding it using Terraform, Ansible, Consul, and Vault, significantly improving scalability, security, and efficiency;
- Created an infrastructure diagram generator using Ansible:
github.com/mbrav/ansible-inventory-diagram.
- Developed custom Rust-based tools to automate workflows:
github.com/mbrav/gitraider.

Banks Soft Systems (BSS) 2022-04 – 2022-11

Release Engineer

- Reduced release build and testing pipeline times by over 3X, significantly improving development efficiency;
- Integrated automated processes for building and testing Docker containers with varying NLP models and Linux distribution configurations (RHEL, CentOS, RedHat, Ubuntu, Rocky) using Bash, Python, Ansible, and GitHub Actions;
- Managed CVE alerts and addressed security vulnerabilities in Docker images by leveraging security scanning tools to ensure compliance with regulatory requirements for banking software;
- Conducted code reviews for an AI voice assistant project, ensuring adherence to best practices, code quality, and functionality.

Genesis Block 2021-11 – 2022-03

Python and Blockchain Developer

- Designed and developed APIs using Flask and FastAPI frameworks in Python, adhering to best software development practices while collaborating with a small team of 5 members;
- Maintained and supported projects integrating smart contracts and other innovative blockchain solutions, ensuring stability and performance;
- Worked closely with development teams and international clients to ensure precise understanding and successful implementation of project requirements.
